Activity

Skiing

Minimum of 25 cm of new snow in meadow at base of ski runs, snow depth 122 cm. On the climb up experienced collapsing and cracks in snow. Kept skin track on low angle slopes. Snow pit approximate location from Gaia, 8081 feet and 45.28793 lat, -111.29025 long. Snow pit data: snow depth 91 cm, ectx. We also performed a Bruce Tremper "If you don't cut the back wall, don't call it a Rutsch Block test". For this test the column of snow had a q2 failure on the first jump. Being old and aspiring to be wise we stuck to low angle slopes and had really nice skiing.

Region

Northern Madison
