Notes

S2 snow most of the day. Light winds, overcast. Extensive large whumpfs and cracks at about 7000-7800 feet. Snow was unsupportable in many places, others had a clear [slab](#) in the midpack you could feel with a pole [probe](#). Dug a pit at 7500 ft on east [aspect](#)...Bottom 30cm was large facets bordering on [depth hoar](#). Clear cups forming and 3-4mm or so (F). CT18. ECTX, which surprised me... I should have done a second test. Was able to propagate on the [depth hoar](#) using a snow saw easily, though did not perform full PST.
