Digging holes and rescuing backpacks on top of Bradley's today. Caught a few glimpses of old crowns, all ran mid-storm. Several size 1-2 storm slabs on the interface in Revolving Door and on the apron below. Looked like a storm slab stepped down to something deeper on the lookers R side of the apron in Wolverine, crown partially filled but looked 1m+, solid size 2 as far as I could tell through the trees.

Any new snow is falling on top of low density stellars, the upper 5-10cm were touchy on this interface, several fresh shallow crowns, cracking etc.

ECTX on top of Bradley's in 3/3 pits. This area has been strangely stable in tests all year despite seemingly poor structure.
