

Reactive wind slab Bradleys

Date

Sat, 01/21/2023 - 11:30

Activity

Skiing

Visible transport on with wind direction shifting from SW to NW in the afternoon. Dug at 7760' asp 85deg slope angle 20 deg on the South side of Bradley's. HS 180 ECTP10 down 25cm. 1F+ hard wind slab over F hardness snow. Slab was not consistent on that aspect at that elevation, we definitely hunted for potential reactivity with many handpits during an avalanche course.

Region

Bridger Range

Location (from list)

Bradley Meadow

Observer Name

S. Regan
