

Natural Avalanche on Climax Path

Date

Sun, 04/02/2023 - 16:40

Activity

Skiing

From email: "Observed very limited terrain due to vis. Saw this very large avalanche on Climax. The crown looks fresh, so it likely occurred the day or night of 4/1?

Hard to tell but the crown looks to be about 4-6' deep at its deepest. The debris ran to the creek.

E [aspect](#) at 10000'.

There were also several smaller soft [slab](#) avalanches that ran on the lookers right side of Climax.

On 4/1 we had a large [collapse](#) on a SE [aspect](#) at 9800' where the MF crust was present under 60cm of new snow.

Winds were L-M with consistent gusts to S on Saturday."

Region

Cooke City

Location (from list)

Woody Ridge

Observer Name

Nina Hance
