From email: "A little bbowl storm skiing for me yesterday afternoon/evening. Measured 20-25cm settled storm snow at base area and 35-40cm at mid and upper mountain. Very [graupel](#)-rich storm, with lots of rimed stellars too. Winds were blowing from the N across the lower mountain and up to the top of bridger, then I got into the calm "detachment zone" with light winds for the rest of the way. Lots of relatively soft [wind slab](#) formation going on, maximum encountered [slab](#) depth was 30-40cm. Localized cracking in these drifts, and some subtle, muffled collapsing.

I found a variable amount of "older" snow underneath the new snow, not from the Oct 17-18th storm, but from earlier this week. This was absent at the base but increased to a variable 5-20 cm on easterly aspects on mid/upper mountain."

Region

Bridger Range

Location (from list)

Bridger Bowl

Observer Name

Ben VandenBos
